
(a) $K = K^S + K^L$ against Γ_{ref}
relative error
splitting parameter ξ
case A
case B
uniform
perturbed lattice
clustered
pair level, max over r
(b) real-space cutoff, $\xi = 0.7$
$\|\Delta\Gamma\|_2 / \|\Gamma_{\mathrm{ref}}\|_2$
ξr_c
uniform
perturbed lattice
clustered
case A
case B
e^{-x^2}
(c) Fourier cutoff, $\xi = 0.7$
$k_c/(2\xi)$
(d) mesh error, uniform N=128, seed 1
$\|\Gamma_L^{\mathrm{mesh}} - \Gamma_L^{k_c}\|_2 / \|\Gamma_{\mathrm{ref}}\|_2$
ξh
$p = 3$
$p = 4$
$p = 5$
$p = 6$
$p = 7$
$p = 8$
(e) $O(h^p)$ fits (open: k_c at $s = 5.5$)
fitted slope of RMS error in h
B-spline order p
case A
case B
uniform
perturbed lattice
clustered
slope $= p$
(f) grid-shift spread (8 shifts,
max / RMS over grid shifts
$\eta = k_c h/\pi$
